THE HURRICANE NETWORK CLEVELAND OH
400 PM CDT SUN JUN 8 2020

...TROPICAL DEPRESSION CRISTOBAL WEAKENING WHILE MOVING OVER
ARKANSAS...
...DANGEROUS FLASH FLOODING EXPECTED THROUGH TONIGHT IN THE
MISSISSIPPI VALLEY...

CURRENT INFORMATION..AS OF 400 PM CDT

ABOUT 135 MI...220 KM WSW OF MEMPHIS TENNESSEE
MAXIMUM SUSTAINED WINDS...35 MPH
PRESENT MOVEMENT...N AT 18 MPH
MINIMUM CENTRAL PRESSURE...994 MB

WARNINGS AND WATCHES

Inland flood watches are in effect for portions of the Mississippi
Valley. High wind advisories are also in effect for portions of the
Mississippi Valley.

For storm specific information relating to your area, please refer
to products issued by your local National Weather Service weather
forecast office.

OUTLOOK

The elongated center of Tropical Depression Cristobal was located at
34.0 north and 92.0 west while moving northward around 18 mph. This
general motion is expected to continue through the next day or two
before a slight turn towards the north-northeast. On the forecast
track, Cristobal will continue to move towards the western Great
Lakes by Wednesday and into Canada early Thursday.

Sustained winds for Cristobal were estimated around 35 mph with
higher gusts. Slight weakening is forecast through Tuesday before
gradual intensification on Wednesday when Cristobal transitions
into a post-tropical cyclone.

The central pressure was recorded near 994 mb by surface
observations.

LAND IMPACTS

RAINFALL: Tropical Depression Cristobal is forecast to produce
additional rainfall totals near 1 to 2 inches along the central Gulf
Coast. Cristobal is also forecast to produce additional rainfall
totals of nearly inches along the Mississippi Valley and portions of
the Great Lakes region. These rainfall totals could create dangerous
flash flooding and areal river flooding for portions of these
regions.

WIND: Winds are starting to decrease for portions of the Gulf Coast
and will fully subside tonight. Strong gusty winds are forecast for
most of the Mississippi Valley and Great Lakes region during the
middle of the week. These winds could be amplified by severe storms
that Cristobal will create during the post-tropical cyclone
transition process.

SEVERE STORMS: Damaging winds, large hail, and some tornadoes are
possible across the Mississippi Valley through Tuesday. These
hazards will move northward towards the Great Lakes region on
Wednesday.

COASTAL FLOODING: Surge levels are beginning to decrease along the
Gulf Coast. There could be a slight increase of wave heights and
tidal currents through this evening.

NEXT ADVISORY

The next public advisory will be at 1000 PM CDT
